Table 2. Assessment Determination

Assessment Determination

Black seabream has been categorised by the IUCN Red List as Least Concern and does not appear on the CITES appendices. The stock structure of black seabream is not known, no stock assessments are conducted, and few species-specific management measures appear to be in place¹. For these reasons, the stock was assessed under Category D.

Black seabream achieved a productivity score of 1.29 and a susceptibility score of 2.75, resulting in a Pass rating from Table D3. Therefore, the species meets the MT byproduct requirements and should remain approved for use as a raw material.

Fishery Assessment Peer Review Comments

The by-product fishery under assessment here is the Black seabream (*Spondyliosoma cantharus*) fishery pursued by French vessels in FAO fishing area 27. The fishery is managed by the French government and the EU common fisheries policy in French waters, the UK and the fisheries act in UK water. For this Marin Trust assessment, Black seabream is scored as a category D as it is not managed to reference points.

All species scoring tables have been completed by the auditor with sufficient evidence presented to support their final determination.

The peer review supports the auditor's recommendation to Pass the fishery under the Marin Trust IFFO RS v2.0 by-fishery standard for the production of fishmeal and fish oil.

Notes for On-site Auditor

Species Categorisation

NB: If any species is categorised as Endangered or Critically Endangered on the IUCN Red List, or if it appears in CITES Appendix 1, it **cannot** be approved for use as an MarinTrust raw material.

IUCN Red list Category

By-product material from a species listed by IUCN (the International Union for Conservation of Nature) under the Red List for the following categories shall immediately fail the assessment;

- EXTINCT (E) AND EXTINCT IN THE WILD (EW)
- CRITICALLY ENDANGERED (CR) facing an extremely high risk of extinction in the wild.
- ENDANGERED (EN) facing a very high risk of extinction in the wild.

By-product material may be used from the following categories provided that all clauses in the MarinTrust standard are passed.

- VULNERABLE (VU) facing a high risk of extinction in the wild.
- NEAR THREATENED (NT) does not qualify for above now, but is close or is likely to qualify for, a threatened category in the near future.
- LEAST CONCERN (LC) Widespread and abundant.
- DATA DEFICIENT (DD) and NOT EVALUATED (NE)

CATEGORY C SPECIES

In a by-product assessment, Category C species are those which are subject to a species-specific management regime and are usually targeted species in fisheries for human consumption.

Clause C1 should be completed for each Category C species. If there are no Category C species in the fishery under assessment, this section can be deleted. Where a species fails this Clause, it should be assessed as a Category D species instead.

Spe	ecies	Name	N/A

CATEGORY D SPECIES

Category D species are those which are not subject to a species-specific management regime. In the case of mixed trawl fisheries, Category D species may make up the majority of landings. The comparative lack of scientific information on the status of the population of the species means that a risk-assessment style approach must be taken.
