Table 2. Assessment Determination

Assessment Determination

Norway lobster has been categorised by the IUCN Red List as a species of Least Concern, and does not appear in the CITES appendices. Norway lobster in FU15 is managed relative to established reference points and subject to annual stock assessment, therefore it was assessed under Category C.

The most recent stock assessment was carried out in 2022, using TV survey data, international catches and discards, and catch sampling. The assessment concluded that stock abundance is substantially greater than the target reference point. For these reasons, the byproduct continues to meet the MT requirements and should remain approved for use as a raw material.

Fishery Assessment Peer Review Comments

The by-product fishery under assessment is Norway lobster (*Nephrops norvegicus*) demersal trawl and creel fisheries in ICES Division 7a, FU 15 (Irish Sea, West) in FAO area 27. The species is classified as LC by the IUCN. The stock is managed relative to biomass-based reference points.

The most recent stock assessment conducted by the ICES Working Group for the Celtic Seas Ecoregion (WGCSE) in 2022 indicated that stock abundance was above the target reference point (MSY B_{trigger}). Therefore, it passes Category C.

The peer review supports the auditor's recommendation to pass Norway lobster demersal trawl and creel fisheries in ICES Division 7a, FU 15 (Irish Sea, West) under the Marin Trust IFFO RS v2.0 by-fishery standard for the production of fishmeal and fish oil.

Notes for On-site Auditor

Species Categorisation

NB: If any species is categorised as Endangered or Critically Endangered on the IUCN Red List, or if it appears in CITES Appendix 1, it **cannot** be approved for use as an MarinTrust raw material.

IUCN Red list Category

By-product material from a species listed by IUCN (the International Union for Conservation of Nature) under the Red List for the following categories shall immediately fail the assessment;

- EXTINCT (E) AND EXTINCT IN THE WILD (EW)
- CRITICALLY ENDANGERED (CR) facing an extremely high risk of extinction in the wild.
- ENDANGERED (EN) facing a very high risk of extinction in the wild.

By-product material may be used from the following categories provided that all clauses in the MarinTrust standard are passed.

- VULNERABLE (VU) facing a high risk of extinction in the wild.
- NEAR THREATENED (NT) does not qualify for above now, but is close or is likely to qualify for, a threatened category in the near future.
- LEAST CONCERN (LC) Widespread and abundant.
- DATA DEFICIENT (DD) and NOT EVALUATED (NE)

CATEGORY C SPECIES

In a by-product assessment, Category C species are those which are subject to a species-specific management regime and are usually targeted species in fisheries for human consumption.

Clause C1 should be completed for each Category C species. If there are no Category C species in the fishery under assessment, this section can be deleted. Where a species fails this Clause, it should be assessed as a Category D species instead.

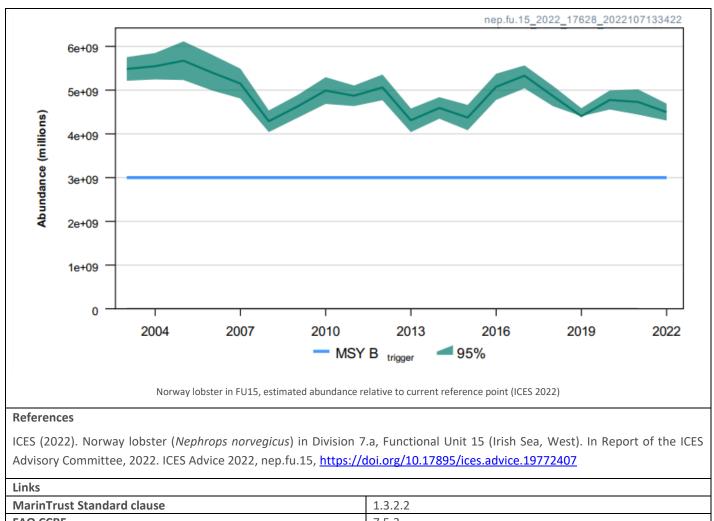

| Spe | ecies | Name | Norway lobster | |
|-----------|-------|-----------------|--|------------|
| C1 | Categ | ory C Stock Sta | atus - Minimum Requirements | |
| CI | C1.1 | | ovals of the species in the fishery under assessment are included in the stock assessment are considered by scientific authorities to be negligible. | PASS |
| | C1.2 | reference po | is considered, in its most recent stock assessment, to have a biomass above the limit pint (or proxy), OR removals by the fishery under assessment are considered by scientific o be negligible. | PASS |
| | | | Clause outcome: | PASS |
| | | | he species in the fishery under assessment are included in the stock assessment proces thorities to be negligible. | ss, OR are |

Norway lobster in FU 15 is subject to annual stock assessment by the ICES Working Group for the Celtic Seas Ecoregion (WGCSE). The most recent assessment was conducted in 2022, using an underwater TV survey, commercial catches including length frequencies from catch sampling, fixed maturity and natural mortality rates, and discard survival estimates. The 2022 catch advice states that "the quality of input data and level of sampling for this stock are considered to be good" (ICES 2022). C1.1 is met.

C1.2 The species is considered, in its most recent stock assessment, to have a biomass above the limit reference point (or proxy), OR removals by the fishery under assessment are considered by scientific authorities to be negligible.

The 2022 catch advice provides an indication of the status of the stock relative to reference points. The target reference points MSY B_{trigger} and MAP MSY B_{trigger} have been set at 3,000 million individuals. Stock abundance in 2023 was projected by the most recent stock assessment to be 4,498 million individuals, and the 2022 catch advice states that "stock size is above MSY B_{trigger}" (ICES 2022). As abundance is greater than the target reference point, it is also above any possible limit reference point, and C1.2 is met.

CATEGORY D SPECIES

Category D species are those which are not subject to a species-specific management regime. In the case of mixed trawl fisheries, Category D species may make up the majority of landings. The comparative lack of scientific information on the status of the population of the species means that a risk-assessment style approach must be taken.
